Test methods, leather testing

Leather testing methods

The official methods of the International Leather Chemists' Societies for chemical leather analysis are denoted by the letters **IUC** and that for the physical testing of leather by the letters **IUP**. Most of them have been adopted as official methods.

The official leather test methods of the German Standard Committee are denoted by the letters DIN. Most of them have been drawn up in conformance with the IUO and IUP methods.

Methods of chemical leather analysis

- IUC/1 General remarks and presentation of analytical results = factually corresponding with DIN 53300/Blatt 2 (10.68) (Das Leder 14, 95–96, 1963) (JSLTC 49, 6, 1965)
- IUC/2 Sampling (as in IUP/2) = factually corresponding with DIN 53302/Blatt 2 (5.68) (Das Leder 14, 96–97, 1963) (JSLTC 49, 8, 1965)
- IUC/3 Preparing the test material by disintegration = factually corresponding with DIN EN ISO 4044
- IUC/4 Determination of substances extractable with dichtoromethane = factually corresponding with DIN EN ISO 4048
- IUC/5 Determination of the water content of leather = factually corresponding with DIN 53304 (12.77) (Das Leder 14, 167–168, 1963) (JSETC 49, 11, 1965)
- IUC/6 Determination of organic and inorganic substances in leather removable by washing (loss by washing) = factually corresponding with DIN 53307 (1.78) (Das Leder 14, 168–169, 1963) (JSLTC 49, 13, 1965)
- IUC/7 Determination of ash and water-insoluble mineral substances = factually corresponding with DIN EN ISO 4047
- IUC/8 Determination of chromium content = factually corresponding with DIN 63309 (10.68) (Das Leder 14, 170, 1963) (JSLTC 49, 17, 1965)
- IUC/9 Determination of water soluble magnesium salts in leather (epsom salt) = factually corresponding with DIN EN ISO 5399

- IUC/10 Determination of nitrogen, ammonlum and skin substance = factually corresponding with DIN 53308 (10.68) (Das Leder 14, 201, 1963) (JSLTC 49, 23, 1965)
- IUC/11 Determination of pH and difference value of aqueous leather extract = factually corresponding with DIN EN ISO 4045
- IUC/13 Determination of zirconium = no corresponding DIN test method available (ISLTC 59, 1, 1975)
- IUC/15 Determination of phosphorus = no corresponding DIN test method available (JSLTC 57, 46, 1973)
- IUC/16 Determination of aluminium = no corresponding DIN test method available (JSLTC 53, 388, 1969)
- IUC/17 Determination of hydroxyproline = no corresponding DIN test method available (JSLTC 64, 57, 1980)

DIN standards not within the IUP range:

DIN 53314 Determination of chromium (VI) compounds in leather

DIN 53315 Determination of formaldehyde in leather

The following methods are in the course of preparation and have not yet been adopted as official methods:

- a. Determination of iron in leather
- b. Determination of free fatty acids in leather
- d. Determination of extractable fat (chamois leather)
- e. Determination of sulphur in leather
- f. Determination of glutaraldehyde in leather
- g. Determination of pentachlorophenol (PCP) in leather

Methods of physical leather testing

IUP /1 General remarks (Das Leder 10, 14, 1959) (JSLTC 42, 382, 1958)

IUP/2 Sampling
= factually corresponding with DIN 53302, Blatt 1 (5.68)
(Das Leder 10, 14–15, 1959)
(JSLTC 42, 382–386, 1958; 48, 377, 1964; 51, 283, 1967; 52, 420, 1968)

IUP/3 Conditioning in standard atmosphere (65 ± 2% RH and 20 ± 2 °C; DIN 50% RH, 23 °C) = factually corresponding with DIN 53303/Blatt 1 (2.79) (Das Leder 10, 15–16, 1959) (JSLTC 42, 386–387, 1958; 48, 377, 1964)

IUP/4 Measurement of thickness = factually corresponding with DIN 53326 (5.78) (Das Leder 10, 16, 1959) (JSLT 42, 387–388, 1958)

IUP/5 Measurement of density = factually corresponding with DIN 53327 (12.70) (Das Leder 10, 16, 1959) (JSLTC 42, 388–389, 1958; 48, 377, 1964)

IUP/6 Measurement of tensile strength, elongation at break and maximum force = factually corresponding with DIN 53328 (2.79) (Das Leder 10, 16–18, 1959) (JSLTC 42, 389–392, 1958; 48, 377, 1964; 60, 125, 1976)

IUP/7 Measurement of absorption of water (Kubelka) = factually corresponding with DIN 53330 (5.78) (Das Leder 12, 36–37, 1961) (JSLTC 44, 367–368, 1960)

IUP/8 Measurement of tearing load = factually corresponding with DIN 53329 (2.82) (Das Leder 12, 37, 1961) (JSLTC 44, 368–370, 1960; 48, 377, 1964; 71, 125, 1987)

(UP/9 Measurement of distension and strength of grain by the ball burst test (Lastometer)
= factually corresponding with DIN 53325 (1.74)
(Das Leder 12, 38–40, 1961)
(JSLTC 44, 374–379, 1960)

IUP/10 Dynamic waterproofness test (Penetrometer) = factually corresponding with DIN 53338/Blatt 1 (4.76) (Das Leder 12, 38–40, 1961) (JSLTC 44, 374-379, 1960)

Test methods.	leather	testing

Dynamic waterproofness test for boot and shoe sole leather = factually corresponding with DIN 53338/Blatt 2 (5.78) (Das Leder 12, 64–65, 1961) (JSLTC 44, 495–497, 1960; 47, 381, 1963; 48, 377, 1964)

IUP/13 Measurement of two-dimensional extension (Tensometer) = factually corresponding with DIN 53323 (1.74) (Das Leder 12, 304–306, 1961) (JSLTC 45, 311–313, 1961)

IUP/14 Measurement of the waterproofness of gloving leathers = no corresponding DIN test method available (Das Leder 12, 85–86, 1961) (JSLTC 44, 498–502, 1960)

IUP/15 Measurement of water vapour permeability = factually corresponding with DIN 53333 (4.78) (Das Leder 12, 86–88, 1961) (JSLTC 44, 502, 1960; 48, 377, 1964; 69, 85, 1985; 72, 1988)

IUP/16 Measurement of shrinkage temperature = factually corresponding with DIN 53336 (1.77) (Das Leder 15, 85–87, 1964) (JSLTC 47, 122, 1963)

IUP/17 Measurement of resistance of air-dried insole leather to heat, particularly during direct vulcanization = no corresponding DIN test method available (Das Leder 19, 130–131, 1968) (JSLTC 50, 379, 1966; 51, 117, 1967; 51, 279, 1967)

IUP/18 Determination of the resistance of air-dried lining leather to heat, particularly during direct vulcanization
= no corresponding DIN test method available
(Das Leder 20, 161–163, 1969)
(JSLTC 53, 161, 1969)

Determination of the resistance of dry upper leather to heat, particularly in direct vulcanization and in moulding on soles during shoe production = no corresponding DIN test method available (Das Leder 20, 39–41, 1969) (USLTC 52, 378, 1968; 52, 419, 1968)

Determination of the flexing endurance of light leathers and their surface finishes (dry and wet) in flexometer actually corresponding with DIN 53351 (1.83) (Das Leder 15 + 20, 87 + 163, 1964 + 1969) (JSLTC 47, 126, 1963; 48, 377, 1964; 67, 94, 1982)

Test method	ts, loather testing
	Discompter)
IUP/21	Measurement of set in lasting with the dome plasticity apparatus (Plastometer) = no corresponding DIN test method available (Das Leder 15, 294–259, 1964)
	(JSLTC 47, 98, 1963; 47, 379, 1963; 48, 377, 1964)
IUP/22	The assessment of surface damage by use of the viewing box = no corresponding DIN test method available
	(Das Leder 15, 295-298, 1964) (JSLTC 47, 101, 1963; 47, 380, 1963)
IUP/23	Measurement of damage caused by scuff = no corresponding DIN test method available
	(Das Leder 15, 298-299, 1964) (JSLTC 47, 107, 1963; 47, 380, 1963; 48, 377, 1964)
IUP/24	Measurement of surface shrinkage by immersion in hot water
	(JSLTC 48, 369, 1964)
IUP/26	Measurement of abrasion resistance of sole leather (JSLTC 53, 470, 1969)
IUP/28	Measurement of resistance to bending of heavy leather (JSLTC 53, 155, 1969)
IUP/29	Determination of cold crack resistance of finishes (JSLTC 69, 85, 1985)
IUP/30	Determination of water vapour absorption and desorption in relation to dimensional changes in the leather (JSLTC 67, 92, 1983)
IUP/32	Measurement of surface area (provisional draft) (ISO 11646)

DIN standards not within the IUP range:

DIN 53331	Determination of stitch tear strength.
DIN 53332	Determination of water vapour absorption.
DIN 53334	Air permeability test.
DIN 53340	Determination of flexing endurance of low flexibility leathers.
DIN 53344	Determination of resistance for hydrolysis of finished and unfinished leathers.
DIN 75201	Determination of fogging characteristics of trim materials in motor vehicles.
	Method A: determination with 60° reflectometer.
	Method B: gravimetric determination.
DIN 75202	Determination of light fastness of trim materials in motor vehicles using the Xenon arc light.
DIN 4841/Part	1 and DIN 4841/E = Protective gloves.
DIN 4843	Protective shoes.

(IUF methods see chapter "Testing of leather dyes and leather dyeings")

Preparation of sample for analysis

The leather specimen for the chemical analysis is passed through a cutter mill, and the pulverized leather is called "leather powder" or ground leather.

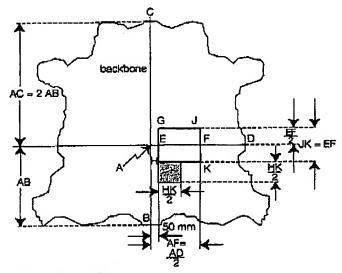

Suitable for this purpose are all types of mills fitted with a 4 mm screen and driven at a speed of $700-1000 \, \text{r.p.m.}$

1;

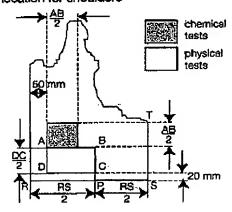

Test methods, leather testing

Sampling according to IUC/2 and IUP/2

1. Sampling location for skins, whole hides and sides

2. Sampling location for shoulders

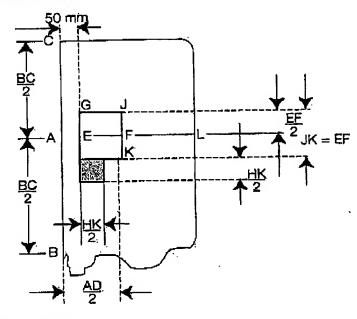

: !;

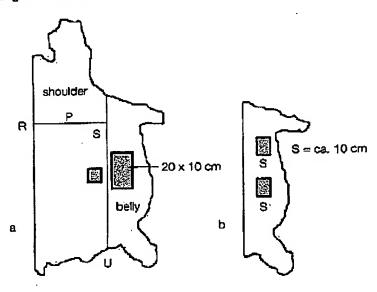

=52.--

Test methods, leather testing

Sampling location for bends

3. Sampling location for bellies (flanks)

- a. sampling location, if no physical tests are requiredb. sampling location, if physical tests are required

Calculation and evaluation of test results

Determination of water content

Water content in % =
$$\frac{G_1 - G_2}{G_1}$$
 - 100

G, = weight of sample before drying G₂ = weight of sample after drying

Determination of substances extractable with dichloromethane (fats and other soluble substances)

Determination of substances removable by washing

a. Total loss washing in
$$\% = \frac{g \text{ solids}}{g \text{ weight of sample}} \cdot 100$$

c. Organic substances removable by washing in % = difference between total loss by washing and sulphated ash removable by washing.

Determination of ash

a. Total ash in % =
$$\frac{\text{g total sulphated ash}}{\text{g weight of sample}} \cdot 100$$

 Water-insoluble ash In % (determined by calculation) = % total sulphated ash minus % sulphated ash removable by washing.

Determination of chrome

a. lodometric determination of chrome

%
$$Cr_2O_3 = \frac{ml/0.1 \text{ N Na-thiosulphate solution} \cdot 0.002534}{g \text{ weight of sample}} \cdot 100$$

b. Titration with iron (II) sulphate solution

%
$$Cr_2O_3 = \frac{\text{mI/0.1 N iron (iii) suiphate solution } \cdot 0.002534}{\text{g weight of sample}} \cdot 100$$

c. Photometric determination of chrome

%
$$Cr_2O_3 = \frac{mg\ Cr_2O_3\ test\ soln. \cdot ml\ sample\ stock\ soln}{1000\ g\cdot g\ weight\ of\ sample\ \cdot ml\ part\ stock\ soln.} \cdot 100$$

Determination of water-soluble magnesium salts

% MgSO₄ · 7H₂O =
$$\frac{\text{ml 0.01 m komplexon (III) solution}}{\text{g weight of sample}}$$
 · 0.2465

Determination of total nitrogen content, content of ammonium salts, calculation of skin substance

a. % total nitrogen = _____ g weight of sample

b. Ammonium nitrogen content in % N = ml aqueous extract · ml 0.1 acid · 0.0014 ml aqueous part extract · g weight of sample

Ammonium sulphate content in % (NH_a)₂ SO₄ = % N · 4.71

c. Skin substance in % = % total nitrogen minus ammonium nitrogen content in % • 5.62

1.

٠.

111

Test methods, leather testing

Difference value

The difference value is the difference between the pH of a solution and hat of its 1:10 dilution.

Fixed tannin (vegetable)

% fixed tannin = 100 minus the sum of moisture, ash, fat, organic loss by washing and skin substance.

Degree of tannage (vegetable)

The degree of tannage indicates the number of parts of tannin fixed by 100 parts of skin substance.

Degree of tannage =

% fixed tannin

100

% skin substance

Yield value (analytical)

The yield value indicates the amount of vegetable tanned leather containing 14% of water obtained from 100 g skin substance.

Apparent density

Apparent density in g/cm³ =

mass (weight) of leather in g

volume of leather in cm³

Volume of leather = d² (in cm) · 3.14 · average thickness (in cm)

Measurement of tensile strength, elongation at break, breaking load

Tensile strength in daN/cm² = daN breaking load thickness in cm · width in cm

Breaking load daN = highest load reached at break

Elongation at break - mm length at break - mm initial length break in % = _______ 100

Measurement of tearing load (split tear strength)

Split tear force in daN = mean value of tearing load

Tearing load in daN = force applied to tear specimen

Stitch tear strength (according to old DIN 53329)

In daN/cm = daN load · 10
mm leather thickness

Water absorption after Kubelka (static)

Water absorption in % by vol. = volume of water absorbed in ml

volume of sample in cm³

weight of water absorbed in g

Water absorption in % by wt. = mass weight of sample in g

Static waterabsorption (simple test)

A piece of leather (ca. 10x10 cm) is completely immersed in water for a defined period (1 or 2 hours).

Static waterabsorption in % by wt. = weight before storage weight after storage

Stripe test

A stripe of leather (ca. 10x1 cm) is hung into water for 2 hours up to a defined mark. The distance the water has risen at the surface and at the edge is determined in mm.

Water absorption, water penetration in penetrometer (dynamic) (Bally penetrometer test)

The most suitable flexing amplitude depends on the thickness of the leather, viz. 5%, 7.5%, 10% or 15%.

Penetration time is recorded in minutes.

Water absorption in % = weight sample after flexing - weight before flexing weight of sample before flexing

Water transmitted in g = gain in weight of absorbent cloth

Maeser test (ASTM D 2099)

Test specimens are flexed in a dilute solution of common salt. The number of flexes endured by the leather at the point at which the water penetrates are counted. The dynamic water absorption is often tested after 15000 to 20000 flexes or at the point of penetration.

Dynamic waterproofness test for sole leather (penetrometer) (dynamic)

Evaluation of the penetration time and the water absorption in the same way as in the penetrometer test. The amount of water transmitted is determined by the weight increase of the absorbent cellulosic board and is indicated

Water vapour permeability (IUP 15)

Water vapour permeability in rng/cm³/h = $\frac{7640 \cdot m}{d^2 \cdot t}$

m = gain in welght in mg between two weightings

d = inner diameter in mm in bottle neck

t = time in minutes between two weighings

Air permeability (DIN 53334)

Air permeability coefficient K = p · T · I

V = volume of air in cm³

p = excess of diminished pressure in cm mercury column

= rate of transmission imminutes

F = free area tested in cm

Abrasion resistance of sole leather

Stather/Herfeld method
 Abrasion coefficient K = percentage of loss in weight of leather after 100 revolutions, calculated on 5 mm thick leather sample.

$$K = \frac{G_1 - G_2}{G_1} \cdot \frac{D}{U} \cdot 2000$$

G, = initial weight of leather sample

G₂ = end weight of leather sample

D = thickness of sample in mm

U = revolutions of emery disc

b. Method according to DIN 53863 (for textiles) Loss by abrasion (loss by abrasion in weight/area) tested in Schopper apparatus; the results are reported in g/m² or mg/mm².

Testing of leather dyes and leather dyeings

CONTRACTOR

18

IUF methods

The second secon

The methods of the International Fastness Union for Leather Dyes and Dyed Leather are denoted by the letters I.U.F. = International Union Fastness.

The following countries are at present members of the International Fastness Union: Belgium, Czech Republic, Denmark, France, Germany, Great Britain, Greece, India, Israel, Italy, Japan, Netherlands, Spain and Switzerland.

Numbering system of guidelines and test methods (IUF 105)

- Group 1 = Includes Nos. 100–199 Scope, principle, assessment; preparation of substrates for producing dyeings.
- Group 2 = includes Nos. 200–299
 Testing the properties of dyes and finishing agents without the aid of leather.
- Group 3 = includes Nos. 300-399
 Testing the properties of dyes and finishing agents by application on leather.
- Group 4 = Includes Nos. 400–499
 Testing the colour fastness of leather.

- dimi

IUF test methods

IUF 105 = Numbering system of guidelines and test methods

IUF 120 = Principles of test procedures

IUF 131 = Grey Scale for assessing the change in colour

IUF 132 = Grey Scale for the determination of the colouring of the accompanying material

IUF 151 = Production of standard chrome calf leather preserved for storage

IUF 201 = Solubility of leather dyes

IUF 202 = Colour fastness of dye solutions to acids

IUF 203 = Stability of dye solutions to acids

1UF 205 = Stability of dye solutions to hard water

IUF 401 = Colour fastness of leather to daylight

IUF 402 = Colour fastness of leather to artificial light (xenon lamp)

IUF 420 = Colour fastness of leather to water spotting

IUF 421 = Colour fastness of leather to water

IUF 423 = Colour fastness of leather to washing

IUF 424 = Colour fastness of leather to formaldehyde

IUF 426 = Colour fastness of leather to perspiration

IUF 434 = Colour fastness of leather to dry cleaning (D) (ISO 11643)

IUF 435 = Colour fastness of leather to washing in the washing machine (D)

IUF 441 = Colour fastness of leather in respect of staining crude crepe rubber

IUF 442 = Colour fastness of leather in respect of staining plasticized polyvinyl chloride

IUF 450 = Colour fastness of leather to rubbing (D)

IUF 454 = Colour fastness of leather to buffing (D)

IUF 455 = Colour fastness to rubbing of leather wetted from the back

a, with organic solvents (D)

b. with water (D)

IUF 456 = Colour fastness of leather to rubbing with pad wetted with cleaning agents (D)

IUF 458 = Colour fastness of leather to hot ironing (D)

IUF 470 = Determination of adhesion of finish to leather (ISO 11644)

(D) = dreft or VESLIC methods

: :

Test methods, leather testing

19 - JOHEPH !!

Testing of leather dyes

Determination of dye class

- a. precipitation reaction
- b. behaviour in dissolving

Determination of pure dye content

- a. determination of ash
- b. spectrophotometer

Testing of homogeneity

- a. blowing test
- b. capillary method

Determination of solubility (IUF 201)

The solubility is tested in distilled water at 20 °C and 60 °C. The amount of dye is determined that stays dissolved after dissolving by boiling and cooling down to the temperatures specified above. The results are recorded in g/l.

30712

Solubility ratings:

5 =	more t	:han	40 g/i
4 =	up to a	and including	40 g/l
3 =	up to a	and including	30 g/l
2 =	up to 8	and including	20 g/1
1=	up to a	and including	10 g/l

Intermediate ratings, e.g., 3–4, may be given. (For the technique of low temperature dyeing (below 40 °C), the dyes to be used should be tested especially for this purpose.)

Testing of dye solutions

Strength of dye solution

Assessment without dyeing test on leather. This can be carried out with the aid of:

- a. colorimeter
- b. filter paper.

Stability to acids (IUF 203)

The resistance of a dye solution to flocculation under the action of formic acid and sulphurio acid.

Ratings:

5 = no flocculation with either one of the two acids

4 = no flocculation with formic acid; beginning flocculation with sulphuric acid

3 = no flocculation with formic acid; flocculation with sulphuric acid

2 = beginning flocculation with formic acid

1 = distinct flocculation with both acids

Fastness to acids (IUF 202)

The resistance of the shade of dye solutions to dilute acids. For testing, the dye solutions are poured on filter paper.

The assessment is made with the aid of the Grey Scale.

Ratings:

from 5

= no change in shade

to 1

= strong change in shade

Fastness to alkali

The resistance of the colour of dye solutions to dilute alkalis. For testing, the dye solutions are poured on filter paper.

The assessment is made with the aid of the Grey Scale.

Ratings:

from 5 = no change in colour

to 1

= strong change in colour

Stability to hard water (IUF 205)

The behaviour of dyes in water of 20 and 40 German degrees of hardness.

Water of the degree of hardness specified above is prepared by dissolving the required amount of calcium chloride and magnesium sulphate in distilled water.

The purpose of this test is mainly to find out whether a dye for brush or spray staining has to be dissolved in condensation water.

Ratings:

5 = no flocculation with hard water

- 4 = no flocculation with water containing 200 mg CaO per litre, beginning flocculation with water containing 400 mg CaO per litre
- 3 = no flocculation with water containing 200 mg CaO per litre, distinct flocculation with water containing 400 mg CaO per litre
- 2 = beginning flocculation with water containing 200 mg CaO per litre
- 1 = distinct flocculation with water containing 200 mg CaO per litre

Testing of leather dyeings

Fastness to formaldehyde (IUF 424)

Determination of the change in shade of dyed leather under the action of formaldehyde fumes.

The assessment is made with the aid of the Grey Scale.

Ratings:

from 6

= no change

to 1

= strong change in shade.

Fastness to fattiquor

The bleeding in anionic fatliquor is assessed according to the behaviour of chrome calf leather dyed with 1% of dye and subsequently fatliquored with 2% of Lipoderm Liquor PN and left in the wet state for two hours under a load between two sheets of filter paper.

The staining of the fitter paper is assessed with the aid of the Grey Scale.

Ratings:

from 5

= no change

= strong staining. to 1

Penetration

The dye penetration is tested on freshly tanned chrome calf leather (neutralized and subsequently dyed) and on crusted chrome suede leather.

Assessment (leather cross-section)

5 = complete penetration

4 = 75% penetration

3 = 40% penetration

2 = 25% penetration

1 = superficial colouring

Levelling power

Can be assessed only on several leathers or batches of leather. The levelness of the dyeing over the entire leather surface and the colouring or covering up of leather faults are assessed.

Fastness to water spotting (IUF 420)

Two drops of distilled water are dropped on the surface of the leather to be tested. After one drop of water has evaporated at 20 °C, the change in shade of the leather is determined with the aid of the Grey Scale. The remainder of the water of the other drop of water is removed with filter paper after 30 minutes, and any physical change is recorded.

Fastness to water (IUF 421)

1

3

Test methods, leather testing

Like the test for fastness to perspiration, but demineralized water is used instead of the perspiration solution.

Fastness to washing (IUF 423)

This property is tested by washing leather with a solution of 5 g/l lauryl sulphate in a neutral (alkall-free) bath and assessing the change in shade and staining of accompanying textile fabric.

The leather specimens are attached to equal sized cuttings of accompanying fabric and washed in 50 times their weight of 0.5% lauryl sulphate solution for 30 minutes at 40 °C in a "Wacker" drum.

The change in shade is assessed with the ald of the Grey Scale for change in shade and the staining of the accompanying fabric is determined with the aid of the Grey Scale for bleeding.

Ratings: from 5 = no change in shade or staining

= strong change in shade or staining.

Fastness to perspiration (IUF 426)

Specified, undyed multifibre fabric (ISO 105-F 10 = cellulose acetate, cotton, polyamide, polyester, acrylic and wool) or homogeneous fibre material soaked in artificial perspiration solution and laid on the side of the leather cutting to be tested. The composite test specimen is placed under a load of 4.5 kg (123 N/cm $^{\circ}$ = 125 p/cm $^{\circ}$) at 37 ± 2 °C for one hour in a suitable apparatus (hydrotester or perspirometer) and is then dried freely suspended under standard climatic conditions (20 °C and 65% R.H.).

On finished leathers, the film is removed with abrasive paper (grit size 180) without damaging the grain surface to any extent.

Perspiration solution per litre:

5.0 g sodium chloride, NaCl;

5.0 g tris-(hydroxymethyl)-aminomethane, NH₂C(CH₂OH)₃; 0.5 g urea, NH₂CONH₂; 0.5 g nitrilotriacetic acid, N(CH₂COOH); adjusted to pH 8.0 ± 0.1 with hydrochloric acid.

Report the numerical ratings for the colour change of each side of the specimen and the numerical rating for the staining of each piece of the specified accompanying fabric with the ald of the Grey Scale.

from 5 = no staining or no colour change Ratings

= strong staining or strong colour change.

Fastness to solvents

Specimens of 1% dyeings $(0.5~\mathrm{g})$ are placed for 24 hours in 20 ml of the appropriate solvent and bleeding of the dye in the solvent is then assessed.

Any solvent desired can be used.

Ratings:

e de la companya del companya de la companya del companya de la companya del la companya de la 5 = no bleeding in the solvent

4 = slight bleeding in the solvent

3 = appreciable bleeding in the solvent

2 = strong bleeding in the solvent

1 = very strong bleeding in the solvent

Fastness to dry cleaning (IUF 434 E)

Accurately measured leather specimens are drummed in a "Wacker" drum for 30 minutes with a solvent, e.g. perchloroethylene or R 113 (trifluorotrichloroethane), together with a specified accompanying multifibre fabric (e.g., ISO 105-F 10) and TEFLON balls (specified size), with or without addition of triolein and solvent soaps. The treated leather specimens are placed between blotting paper under a load of 4.5 kg for 1 minute and aired off. They are then examined for change in shade, handle, colour, staining of the accompanying fabric and, if necessary, for changes in wettability, light fastness and rub fastness (dry and wet).

Dry and wet rub fastness

Testing by hand

a. Dry: Rubbing with an untreated white cotton cloth tightly stretched over a cork

stopper. Rub ten times back and forth with constant pressure.

b. Wet: Same procedure as in the dry test, except that the cotton cloth is moistened with

distilled water and squeezed off to about 100% water uptake.

Test with VESLIC rub fastness tester (IUF 450)

A dry felt pad or a felt pad moistened with water in the prescribed way is rubbed back and forth under a load of 1 kg on the leather that has been stretched by 0% or 10%.

Dry: 20, 50 and 150 rub strokes (if necessary up to 300 and 500 rub strokes)

Wet: 10 and 50 rub strokes

Report the numerical ratings with the aid of the Grey Scale for the staining of the wool felt and for the change in colour of the leather.

Fastness to diffusion into crude rubber crepe (IUF 441)

The behaviour of the dyeing with regard to migration of dye from the leather into crude rubber crepe is tested. The test specimen is bonded on the side to be tested to crude rubber crepe using white pigmented crude rubber solution and is exposed under a load of 4.5 kg at 50 °C for 15 hours.

The assessment is made with the aid of the Grey Scale.

Fastness to diffusion into PVC (IUF 442)

The behaviour of the dyeing with regard to migration of dye from the leather into plasticized polyvinyl chloride is tested.

The assessment is made with the aid of the Grey Scale.

Fastness to buffing of dyed leather (IUF 454)

The behaviour of the dyed leather is tested by buffing. The leather side to be tested is rubbed back and forth 10 to 110 times on the VESLIC rub fastness tester with a carborundum emery paper (grit size 320) under a load of 500 g.

The assessment of change in colour between the lanes after 10 to 110 rub strokes is made with the aid of the Grey Scale. Before the assessment of the change in colour, the buffed area is brushed in the direction of the nap.

Light fastness

- a. Fastness to daylight (IUF 401)b. Fastness to artificial light (Xenon lamp IUF 402)

Leather specimens of not less than 1 cm \times 6 cm are exposed to daylight or artificial light under prescribed conditions together with eight light fastness standards which consist of pieces of wool cloth dyed with standard blue dyes of different degrees of fastness.

Standard	Colour Index designation = C.I. Acid Blue 104
2	= C.I. Acid Blue 109
3	= C.I. Acid Blue 83
4	= C.I. Acid Blue 121
5	= C.I. Acid Blue 47
6	= C.I. Acid Blue 23
7	= C.I. Solubilized Vat Blue 5
R	= C.I. Solubilized Vat Blue 8

The fastness is assessed by comparing the fading of the leather specimen with that of the standards. The result is expressed in a numerical fastness rating.

- 1 = very low
- 2 = low
- 3 = moderate
- 4 = fairly good
- 5 = good
- : 6 = very good
 - 7 = excellent
 - 8 = outstanding

Intermediate ratings can be given.

For leather testing, the ratings from 1 to 6 will suffice, because the test results are influenced by the amounts and types of tanning agents, fatliquors and auxiliaries used and by the strength of the dyeing and the dyeing method.

ACT OF THE PARTY O

Test methods, leather testing

wienerfeiter with

Testing of leather finishes

Dry and wet adhesion (IUF 470)

Measurement of the adhesion (anchorage) of a finish coat to the leather surface.

- a. Quick reference test method with adhesive tape.
- b. Quantitative measurement in the tensile strength testing apparatus. Leather strips of specified length and width are bonded with a specified adhesive to a firm supporting surface which has been cleaned with hexane or a mixture of alkane at a boiling range of 40–80 °C. The bonded specimens are then stripped off in the tensile strength tester at an angle of 90 degrees. At least 4 specimens are tested, two of each in the cross and longitudinal directions to the backbone line.

For the wet adhesion test, the bonded specimens are placed in a glass filled with water. The glass with the specimens is evacuated three times in a vacuum dissicator at 5 kPa maintaining the vacuum each time for 2 minutes. The time between the placing of the specimens into the water and the measuring should be from 60 to 120 minutes.

Composition of adhesive:

A two-component polymer adhesive is used.

20 g Solids Desmocoll 400 dissolved in 800-1000 g ethyl acetate

+ 5 g Hardener Desmodur L 75

The prepared adhesive mixture should be used up within 8 hours after addition of the hardener.

Dry and wet rub fastness

Assessment of the resistance of the finished leather surface to abrasion, scuffing and staining.

- Quick reference test by rubbing with a white cloth under the pressure of a finger.
- b. Test with SATRA rub fastness tester Rubbing a rotating felt pad under a given load for a specified number of revolutions against the finished leather surface. The dry rub fastness is tested with a dry felt pad under 2.5 kg load, and the wet rub fastness test with a wet felt pad under 0.75 kg load.
- c. Test with VESLIC rub fastness tester (IUF 450) Rubbing a dry felt pad or a felt pad moistened in a prescribed way under a pressure of 1 kg back and forth against the leather that has been stretched by 10%. Dry rub fastness: leather dry, felt dry, 50–1000 rubbing strokes. Wet rub fastness: leather dry, felt wetted, 20, 50, 150, 300 rubbing strokes.

Assess the degree of damage or change in the finish coat, staining of the felt pad and change in colour of the test specimen.

Resistance to swelling

Assessment of the behaviour of a finish coat when the whole leather is submitted to the action of water.

- Quick reference test by immersing the leather specimen in water and rubbing subsequently with a dry cloth.
- Test with VESLIC rub fastness tester

The leather specimen is immersed in water for 1 hour, and a dry felt is then rubbed back and forth 20–2000 times under a load of 1 kg on the leather.

Rating as in the dry and wet rub fastness tests.

Flexing endurance (IUP 20)

Measurement of the flexing endurance of leathers and their surface finishes through an angle of 22.5 degrees over a prolonged period. The test is carried out with the Bally flexometer, and the leather specimen is examined after 1000, 5000, 10000 and every additional 10000 flexings up to 50000 flexings.

Assessment of damage:

- a. Damage to the finish may be of the following kinds: greying, minor and major surface cracks or complete breakthrough, peeling or powdering, loss of adhesion of the finish to the leather or loss of adhesion of one finish layer to another.
- b. Damage to the leather may be of the following kinds: cracking of grain layer, development of coarse grain folds (pipey grain), loss of an embossed grain pattern, breakdown of fibres to such an extent that a hole develops through the entire thickness of the leather.

This test can be carried out with both dry and wet leather specimens.

Elasticity

Behaviour of the finish when the leather is stretched and extended.

- a. Quick reference mandrel or key test.
- Test with Lastometer (IUP 9) or Tensometer (IUP 13).
 Assess the changes or the breaking of the finish coat before the grain cracks.

with the state of the state of

Test;methods; leather testing

andien a wide: andheat to the .

Fastness to hot ironing

- a. The leather specimen is placed over a slightly rounded edge and plated once back and forth with a hot iron maintained at a constant temperature by thermostat. After each ironing, the test temperature is increased by 25 degrees Celsius. The change in shade, smearing and damage to the finish coat are assessed.
- b. Test with VESLIC automatic hot ironing tester (VESLIC rub fastness tester with heatable finger). The finger has a size of 10 mm x 10 mm and is moved back and forth five times after which the temperature is increased by 20 °C. This is repeated until the finish coat shows damage, smearing or change in shade.

Resistance to hot air

The leather specimen is submitted to the action of a hot air stream at 150 °C for one minute. The change in shade and other changes in the finish coat are assessed.

Fastness to hot steaming

The leather specimen is placed in a test chamber at 65 °C and 100% relative humidity. The migration of dye, bleeding and swelling are assessed.

Light fastness

The light fastness is tested with the xeno tester (cf. page 274).

Resistance to solvents

Acetone is normally used for the test.

- a. Test with SATRA rub fastness tester One ml solvent is dropped on the unfinished side of the leather within 30 seconds. The test specimen is left lying with the finished side up for 2 minutes at room temperature, and it is then rubbed five revolutions on the tester under a load of 2.5 kg.
- b. Test with VESLIC rub fastness tester From the rub fastness tester, the base plate in the center of the carriage is removed and replaced by a felt over which the leather specimen is clamped with a distension of 5%. One ml solvent is dropped at the side on the felt, and after one minute, the leather is distended once again by 5% and it is then rubbed five times with a dry felt on the finished side under a load of 1 kg.

The finish coat is examined for swelling, softening or smearing.

37.00

Résistance to detergents and cleansing agents

Similar to the wet rub fastness test, the finished leather surface is tested with various test solutions.

Resistance to shoe polishes

The leather specimen is tested by rubbing with three basic types of shoe polishes.

Polishability

A drop of water (about 0.15 ml) is applied to the finished leather surface and allowed to evaporate overnight at room temperature. The leather specimen is rubbed with a dry cloth, if nacessary after treatment with shoe polish, to determine whether any stains formed can be removed by polishing.

Resistance to abrasion

Measurement of the resistance of the leather surface to abrasion.

For this purpose, the VESLIC rub fastness tester is used on which the felt for the rub-fastness test is replaced by a rubber-based abradant surface 15 mm long and 3 mm wide that is rubbed along separate paths against the leather for a fixed number of times under a specified load.

Under a load of 2 kg:

10'to 50 rubbing strokes

Under a load of 5 kg:

5 rubbing strokes

The leather can be tested wet or dry.

The test specimen is examined for changes in the leather surface and for change in shade with the aid of the Grey Scale.

Resistance to ageing

The leather samples are conditioned in the drying oven for

- a, 7 days at 50 °C or
- b. 3 days at 80 °C

before they are examined for embrittlement or yellowing and for changes in elasticity and flexing endurance.

et plaint cityes that the

Fogging test (DIN 75201)

Fogging refers to the condensation of evaporated, volatile components of the interior automobile trim materials on the glass plates, especially on the wind shield.

The test consisting of two different methods is carried out with the fogging tester of Haake-Meßtechnik, Karlsruhe, Germany.

- a. Reflectometric test A car uphoistery leather specimen is placed on the bottom of a glass beaker which is immersed to a certain depth into a heated bath(100 °C) regulated by thermostat. On top of the glass beaker, which is closed by means of a cleaned glass plate with seal, cooling plates maintaining a temperature of 21 °C are placed. The cooling causes the substances evaporating from the leather to condense on the glass plate. The quantity of fogging condensation on the glass plate is recorded by measuring the 60° angle of reflection of the same glass plate (blind value) without condensation.
 - Fogging value $F_a = \begin{cases} \text{quotient in \% of the 60}^\circ \text{ reflectometer value of a glass plate with fogging condensation and the same glass plate without condensation.} \end{cases}$
- b. Gravimetric test Instead of the glass plate used in the reflectometer test, a light aluminium sheet is used here and the specimens are treated for 16 hours instead of 3 hours at 100 °C. The condensate is weighed and reported in mg.

Both test methods prescribe that the specimens be dried for 7 days in a dissiccator using phosphorous pentoxide.
